Downed utility lines, power company blackouts, heavy snow falls or summer storms can all lead to power outages. Many people turn to a portable generator for a temporary solution without knowing the risks.

GENERATOR SAFETY:

- » Generators should be used in well ventilated locations outside away from all doors, windows and vent openings.
- » Never use a generator in an attached garage, even with the door open.
- » Place generators so that exhaust fumes can't enter the home through windows, doors or other openings in the building.
- » Make sure to install carbon monoxide (CO) alarms in your home. Follow manufacturer's instructions for correct placement and mounting height.
- » Turn off generators and let them cool down before refueling. Never refuel a generator while it is running.
- » Store fuel for the generator in a container that is intended for the purpose and is correctly labeled as such. Store the containers outside of living areas.

Just Remember

When plugging in appliances, make sure they are plugged directly into the generator or a heavy duty outdoor-rated extension cord. The cords should be checked for cuts, tears and that the plug has all three prongs, especially a grounding pin.

If you must connect the generator to the house wiring to power appliances, have a qualified electrician install a properly rated transfer switch in accordance with the National Electrical Code (NEC) and all applicable state and local electrical codes.

FACT

CARBON MONOXIDE DEATHS ASSOCIATED WITH GENERATORS HAVE SPIKED IN RECENT YEARS AS GENERATOR SALES HAVE INCREASED.
